

MICROCOOL, increasingly closer to the world of overclockers

Lanciano (CH), May 8th, 2007 – Sfera-OC-Team, an Italian group of overclockers sponsored by Microcool is approaching the world record of operating frequency in the CPU category, almost close to 8GHz.

This result was achieved cooling an Intel Pentium 4 641 processor with liquid nitrogen and keeping its operating temperature at -165°C. To ensure proper system stability, the Sfera OC Team has used our NorthPole XE whisper to cool the northbridge of the ASUS COMMANDO motherboard. The Microcool chipset heatsink performed excellently even in such extreme situation much beyond its standard use. This outcome once again confirms that the high construction quality of the NorthPole XE whisper is a guarantee of success.

Microcool thanks the Sfera OC team for the results achieved and invites all the overclock lovers to contribute to the topic: <http://www.hwmania.org/forum/showthread.php?t=67>
