

**MICROCOOL presents NorthPole XE whisper, the first cooling system that sets a new standard in noiseless PC**

Rome, January 9th, 2006 – MICROCOOL, a leading company in the IT industry for motherboard heating management systems, is proud to present NorthPole XE whisper, the first cooling system for the Northbridge and for processors of the Intel® Pentium® M family for desktop solutions.

The new Microcool cooler, an evolution of the NorthPole, is designed to ensure unmatched sound comfort and performance. In fact, despite its small size, Microcool NorthPole XE whisper ensures perfect heat management in any working conditions, with an overall working noise well below 18dB. The 40x40x15 mm fan, with double bearing and variable voltage based on the copper sink temperature, is the real strength point. The thermal probe, located between fan and the heat sink fins, enables real-time change of the rotation speed in a range between 1500 RPM at 25°C and 5000 RPM at 50°C.

Microcool NorthPole XE whisper is the new reference for chips up to 35W power, the winning solution for SFF PC and HTPC.
